

Video recording system utilizing Miniature Digital Camcorder

Abstract

A video recording system utilizing one or more Miniature Digital Camcorders (MDC) which facilitates recording digital video of user's activity without diverting the user's attention from said activity or encumbering the user's performance of the activity. A wireless Remote Control allows controlling the start and stop function of one or more MDC units without distraction from the activity. Due to multiple MDC units responding to commands from a single Remote Control, the video captured by all such units is automatically synchronized. The video thereby created is suitable for subsequent transfer to a Personal Computer for viewing and editing.
